RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 100 pages. Original publisher: Reston, Va. : U. S. Geological Survey, 2007. OCLC Number: (OCoLC)122259908 Subject: Hazardous geographic environments -- Yellowstone National Park. Excerpt: . . . these swarms. Although earthquake triggering and changes in geyser activity have been documented elsewhere, these notable changes at Yellowstone induced by a large-magnitude event at such a great distance indicate the profound effects that remotely triggered seismicity can have on hydrothermal and earthquake hazards and also suggests that earthquakes and hydrothermal explosions at Yellowstone might be triggered by local earthquakes in the future. Crustal deformation Major surface deformation has been recognized in Yellowstone since precise leveling surveys were repeated in 1975-1977 after a lapse of 50 years. Caldera-wide uplift to a maximum of at least 73 cm ( fig. 15 ) was documented in these surveys ( Pelton and Smith, 1979, 1982 ). Similar uplift continued, as measured repeatedly in several following years ( fig. 16 ), averaging 23 mm y from 1976 to 1983, then slowing down for about a year before subsiding as much as 35 mm y until 1987 ( Dzurisin and Yamashita, 1987; Dzurisin and others, 1990 ). Since these surveys, newer methods, including the Global Positioning System ( GPS ) and Interferometric Synthetic Aperture Radar ( InSAR ) have shown that surface deformation remains active over the entire area of the Yellowstone caldera and the seismically active area to the northwest, including the epicenter of the 1959 Hebgen Lake earthquake. Both uplift and subsidence occur in this area, sometimes in a caldera-wide fashion and at other times in more complex patterns of more local uplift and subsidence ( Meertens and Smith, 1991; Wicks and others, 1998; Puskas and others, 2002; Wicks and others, 2006; Puskas and...
